

TeachDB: Building Memory Layers for Historical Figures

TeachDB is a platform for building Memory Layers of historical figures. A Memory Layer preserves the complete accumulated knowledge of one individual. Rather than creating a new AI model, TeachDB enables any future Large Language Model (LLM) to reason from this preserved knowledge. Knowledge remains; reasoning evolves.

Why TeachDB Now?

Today's Large Language Models (LLMs) possess broad, generalized knowledge, yet they fail to preserve the complete, structured, and nuanced knowledge inherent to a specific historical figure. Consequently, these models struggle to consistently answer from the distinct perspective of an individual thinker. TeachDB addresses this gap by introducing dedicated Memory Layers, ensuring that the unique intellectual foundation of a figure is preserved and accessible.

Proof of Concept: Gentaku Otsuki

The objective of this Proof of Concept (PoC) is not to develop a better AI model. Instead, we aim to verify that a dedicated Memory Layer enables deeper historical understanding than what can be achieved by general-purpose AI alone. By focusing on the Gentaku Otsuki Memory Layer, we demonstrate how high-fidelity primary sources can elevate the accuracy and depth of AI-assisted historical inquiry.

Architecture

User → Gentaku Otsuki Memory Layer → RAG → LLM → Insightful
Answer

Vision: Kenjindo (House of Wisdom)

We envision *Kenjindo* as a digital library where every historical figure possesses their own dedicated Memory Layer. This ecosystem serves as long-term infrastructure for education, museums, libraries, and future AI systems, transforming how we engage with human history.

*Humans preserve knowledge. AI generates understanding.
Knowledge remains. Reasoning evolves.
Memory Layers become permanent cultural assets for future generations.*
